

Note: Please verify the white side of the cover will face upward when unfolding to avoid rolling out backwards and having to reposition an open cover. Cover seams should run vertically over the pile to allow for rain run-off from the pile.

This is a typical cover size being unfolded and does not represent all FeedFresh[®] cover variations.

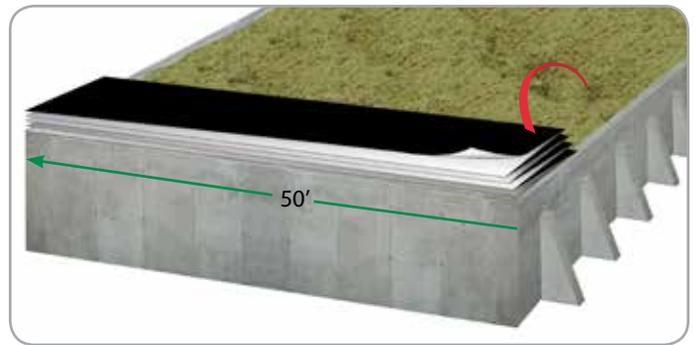

1
STEP

Unroll entirely across the **Width** of the pile.

2
STEP

Unfold accordin-pleats along the **Length** of the pile.

Final Layout

VIAFLEX Silage Covering Recommendations

Covering is extremely important to keep air and moisture from penetrating into the silage mass. Plastic should be weighted down with some form of dunnage to keep the plastic tightly secured and in direct contact with the silage mass.
